## SOLAR TESTS

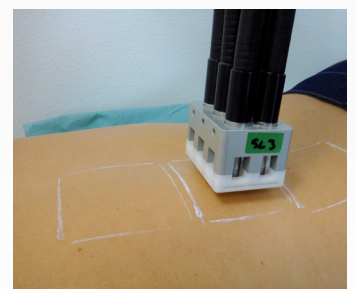

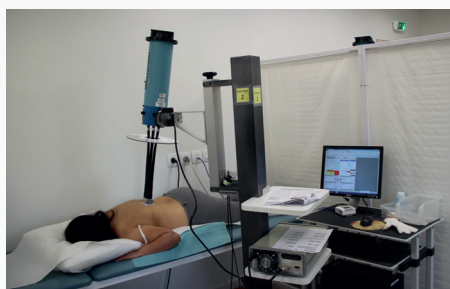

### AS MEMBER OF BIPEA WE COMPARE OUR RESULTS

Concerned about the quality of its services, Dermscan is a member of BIPEA (Interprofessional Bureau of Analytical Studies). We participate in solar tests intended to compare and standardize the results obtained in various suppliers of clinical trials.

As part of this program, since March 2012 we performed 12 solar studies whose objective was to identify Sun Protection Factors with expected claim from 8 to 50+ with or without Water Resistance, and 5 studies to determine UVA protection factors.

Dermscan follows logic of continuous improvement of its services. Thus after comparison of our results, where we were located 7 times in the average or the upper average, we have been willing to get even closer to the average SPF.

### IMPROVED AND OPTIMIZED SOLAR SERVICES

Thanks to an effective teamwork on different criteria (mainly the methods of standardized applications, collegial readings etc.) and on products with specific galenic such as oils or powders, **we have optimized the accuracy, the consistency and the performance of our solar tests.**

**Since 1990, Dermscan guarantee the best conditions to determine static or WR SPF and Sweat resistancy. We take advantage of three locations to perform your solar testing: Dermscan France, Dermscan Poland and Dermscan Asia.**
